Business Case

When Growth Fails to Create Value

Monetization Efficiency Breakdown and Revenue Driver Decomposition

Yujin Jeon | Sales Analyst

Growth accelerated, but monetization efficiency weakened

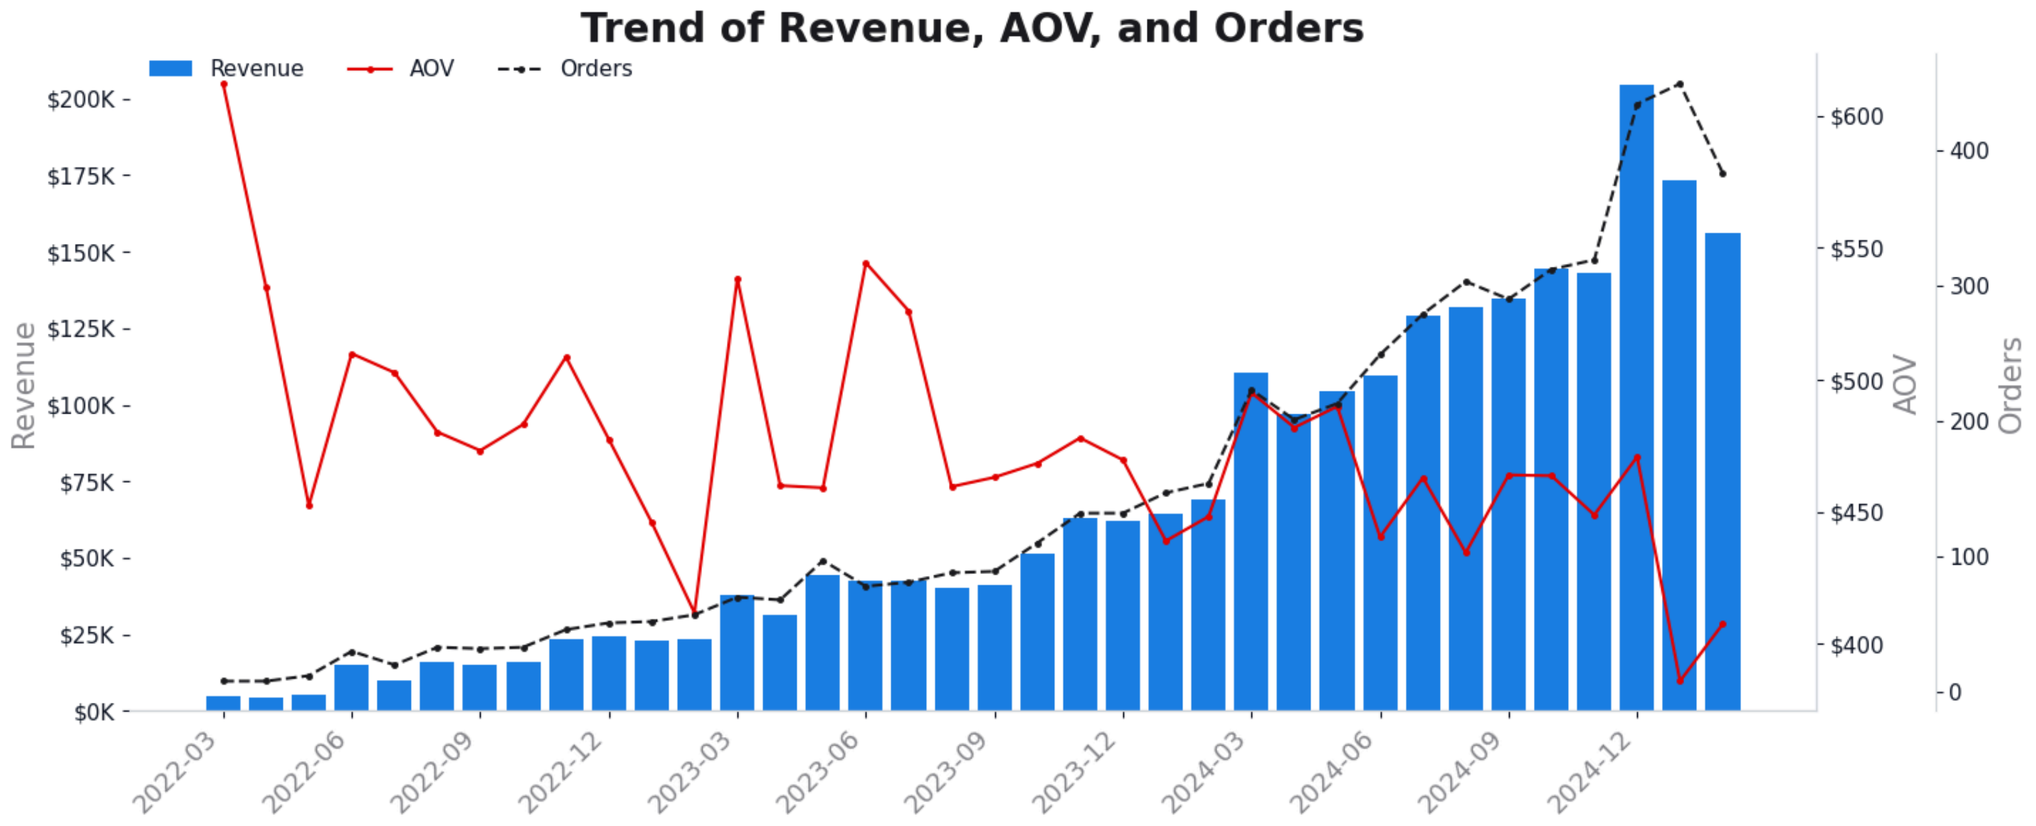
+147%	+176%	+85%	-11%
Revenue (YTD YoY)	Orders (YTD YoY)	Users (YTD YoY)	AOV (YTD YoY)

- Revenue growth outpaced user growth, but monetization efficiency deteriorated.
- Growth is increasingly driven by transaction volume rather than value per transaction.
- Current growth model is structurally inefficient

Shift from volume-led growth to value-driven growth

02 Performance Trend

Decoupling of Revenue Growth and Monetization Efficiency



- Revenue growth increasingly decoupled from value creation, as AOV declined despite sustained order expansion
- Growth increasingly required higher transaction volume per unit revenue

03 Revenue Driver Bridge

Volume-driven growth with declining transaction value

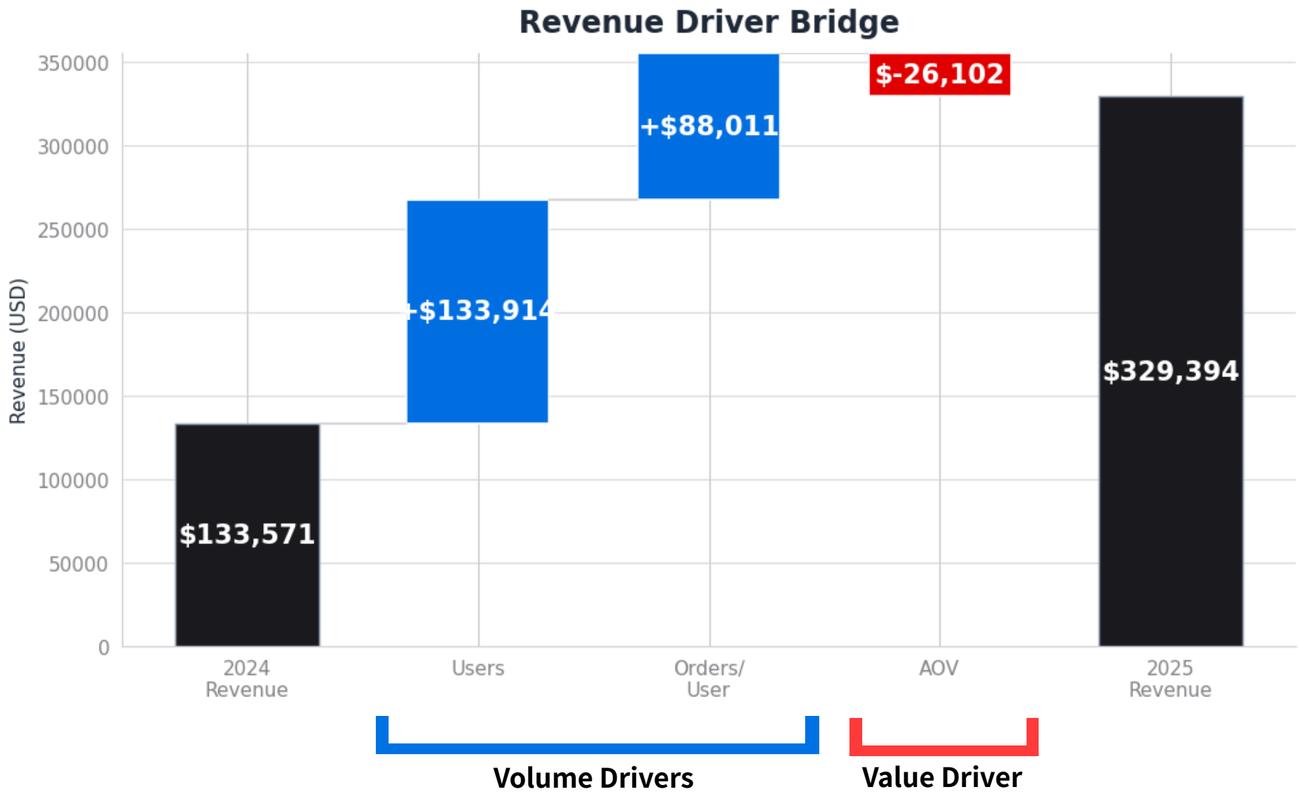
What drove growth?

Volume Drivers (+$222K)

- Users +$134K
- Frequency +$88K

Value Driver (-$26K)

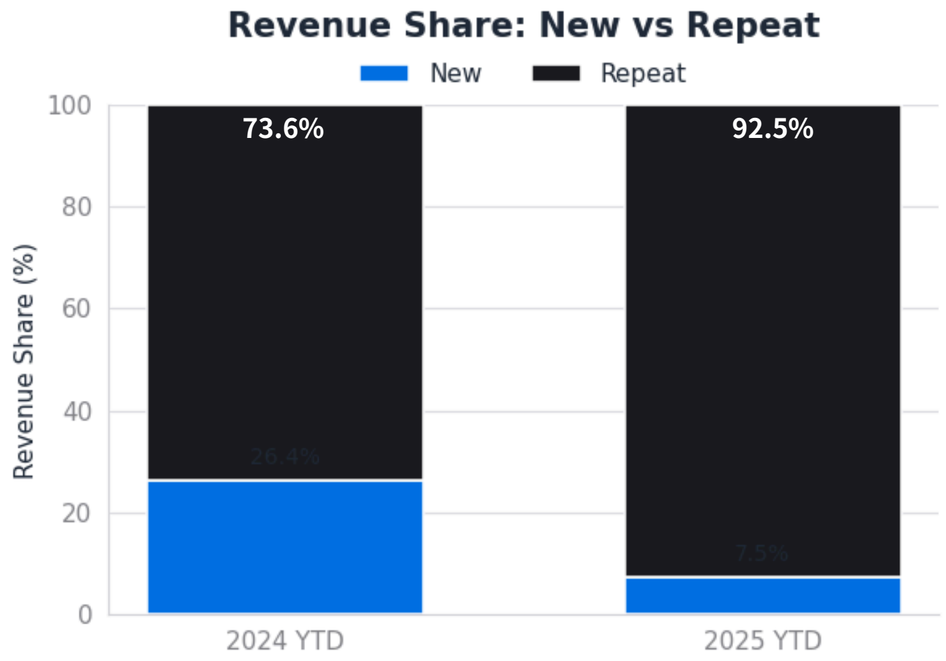
- AOV (-$26K) partially offset growth

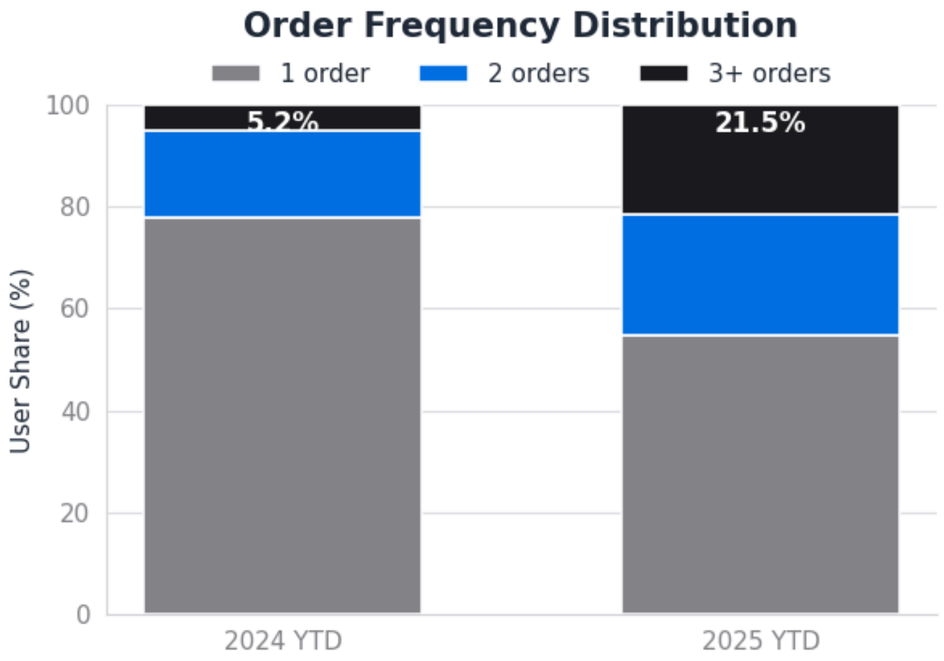


Revenue growth was primarily driven by volume expansion, with negative contribution from transaction value

04 Growth Engine Shift

Higher purchase frequency drove growth





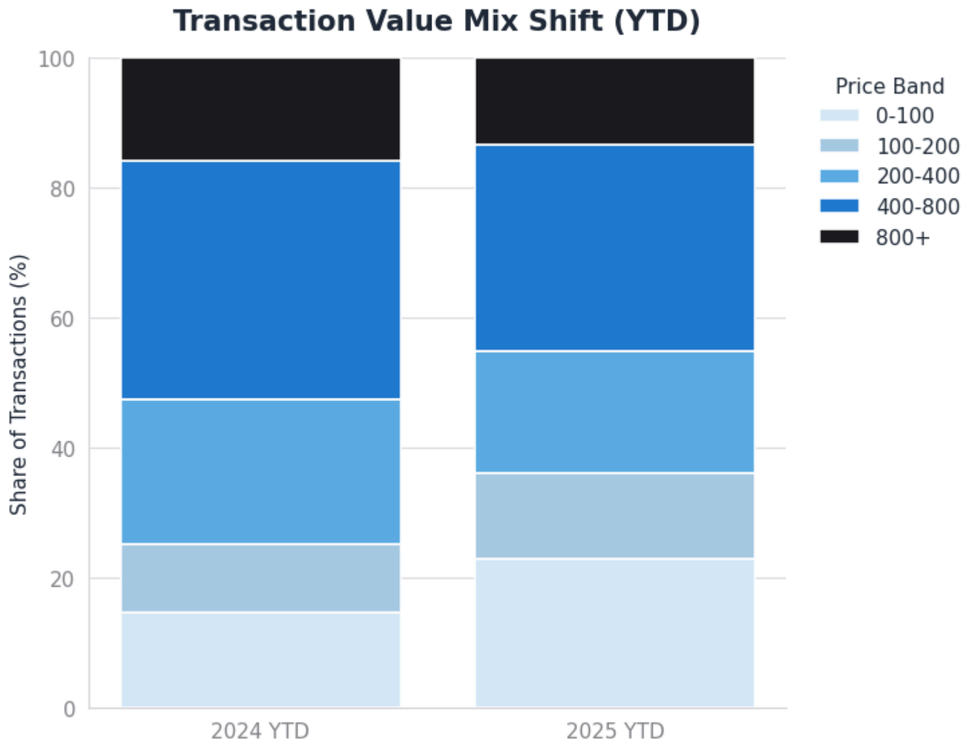
- Contribution from new customers declined across users, orders, and revenue
- Growth became increasingly dependent on existing users, raising sustainability risk
- Increased orders per user accounted for a significant share of growth

Growth was primarily driven by increased activity within the existing customer base

05 Transaction Value Analysis

Transaction value distribution shifted downward

- Median transaction value declined alongside AOV
- Increase in low-value transactions drove the overall decline
- High-value transaction share contracted

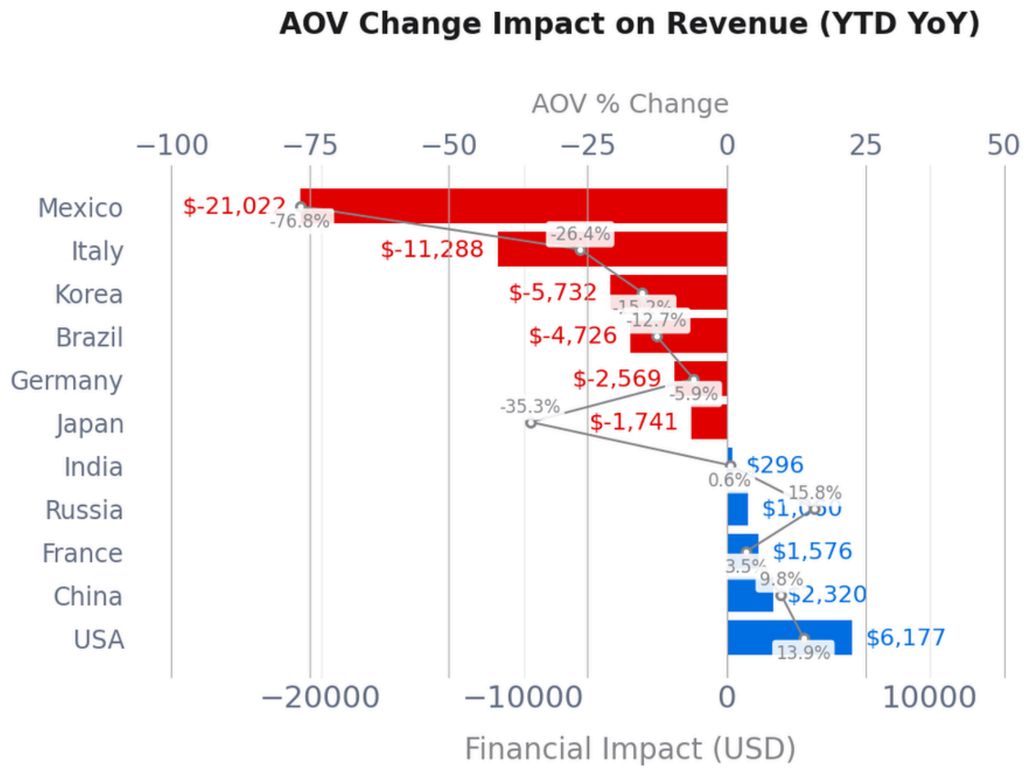


The entire transaction-value distribution shifted downward, not just the average

06 AOV Change Impact

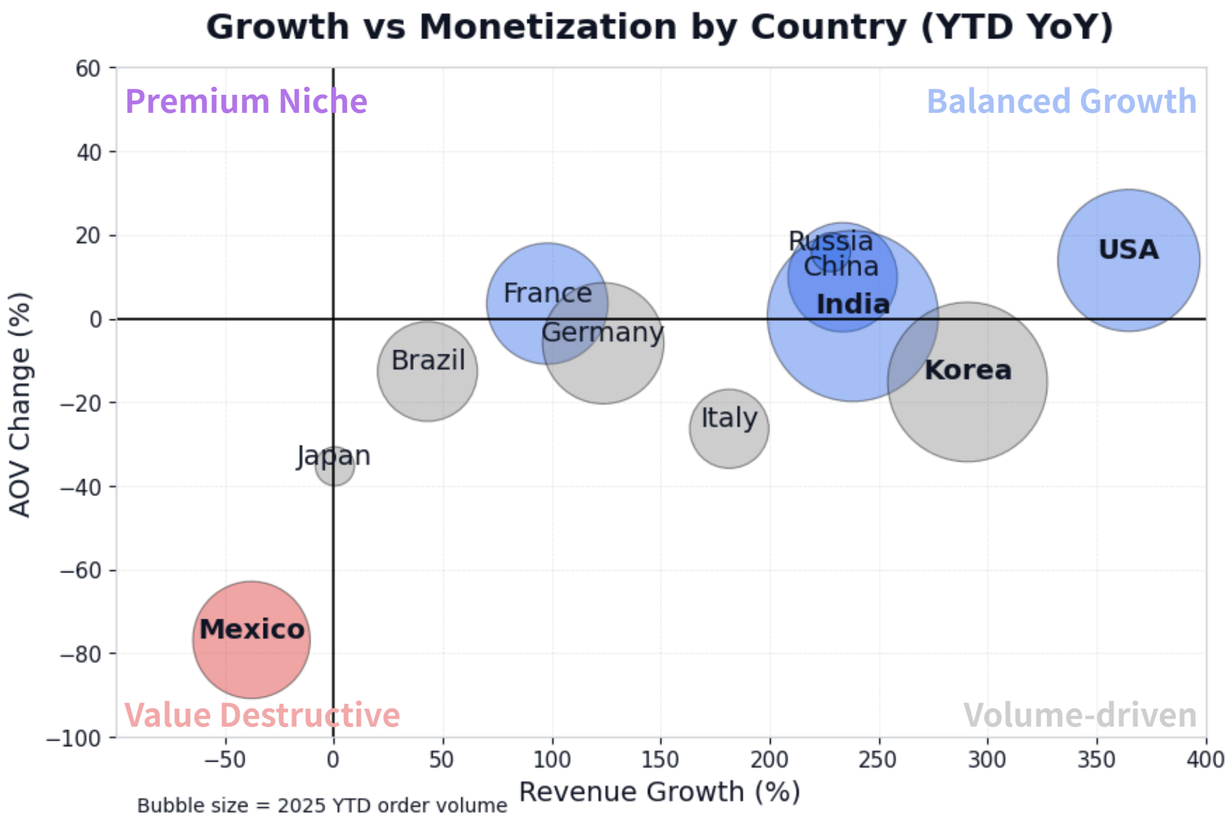
AOV-driven revenue impact is concentrated in key markets

- AOV decline materially eroded revenue gains in key markets
- Impact is concentrated in Mexico and Italy, indicating structurally uneven monetization performance



Declining transaction value reduced realized revenue gains despite strong volume growth

Growth vs Monetization by Market



- **USA and China:** balanced growth (revenue and AOV)
- **Mexico:** negative growth quality with sharp AOV decline
- **Korea and Italy:** volume-driven growth with declining AOV
- **Japan:** declining demand despite lower transaction value

Growth quality differs significantly across markets,
with high-growth regions often driven by lower-value transactions

Improve Growth Quality and Restore Transaction Value

1
Recover Transaction Value

Actions:

- Track transaction value distribution (price band / basket size)
- Reduce low-value transaction mix via pricing and promotion control
- Audit discount impact (discount vs non-discount mix)
- Set AOV guardrails and enforce value-based KPIs

2
Validate Growth Quality

Actions:

- Decompose revenue into new vs repeat cohorts
- Track repeat dependency and cohort-based conversion
- Measure revenue per user (new vs repeat)
- Analyze frequency vs AOV trade-off

3
Market-Specific Execution

Actions:

- Classify markets by growth type (volume-driven vs value-driven)
- Apply differentiated pricing and promotion strategy by market
- Redesign pricing in value-destructive markets (Mexico, Italy)
- Expand high-value offerings in strong markets (USA, China)

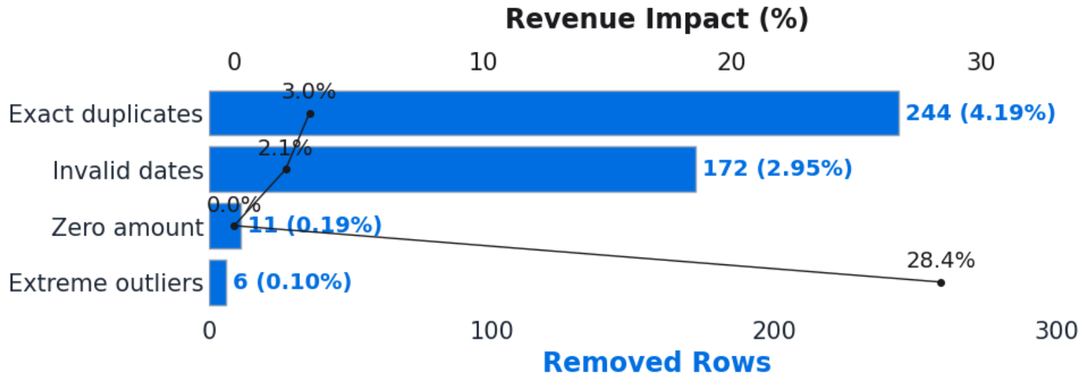
Appendix

Data Refinement: Neutralizing Potential Distortion

Dataset Profile

- Raw: 5,825 rows → Clean: 5,392 rows (-7.43%)
- Date range: Feb 2022 – Mar 2025
- Analysis period ‘YTD’: Jan–Feb (YoY comparison)

Field	Description
Transaction ID	Transaction reference (not unique)
User ID	Customer identifier
Country	Customer location (11 countries)
Transaction Date	Date of purchase
Amount	Transaction value (USD)
Payment Method	Card, PayPal, Apple Pay



Issue categories may overlap; revenue percentages indicate directional distortion relative to raw revenue.

Filtering Methodology

Removed duplicates, invalid dates, zero amounts, and outliers.
All reported insights are based on this filtered core dataset;

- Exact duplicates: 244 rows (4.19%)
- Invalid dates: 172 rows (2.95%)
- Zero amounts: 11 rows (0.19%)
- Extreme outliers: 6 rows (0.10%)

Note: Duplicate transaction_id rows with distinct amounts flagged as valid multi-SKU purchases and preserved.

I connect analysis to action.
